ABSTRACT

To investigate whether there are significant numbers of academically talented students in disadvantaged populations (black and non-black) who do not pursue a higher education, 28,000 National Merit Scholar Qualifying Test participants were administered a questionnaire. The sample was divided into 72 subgroups formed on the basis of race (black or non-black), sex, ability level, and geographic region of residence. The results, despite a low response rate, strongly suggest that the test-bright achiever of either race is almost certain to enter college ragardless of factors such as sex or parental earnings. Data are reported on the location and type of college attended, freshman year persistence, and grades obtained. (JS)

Black and Nonblack Youth: Characteristics and College Attendance Patterns

Donivan J. Watley

NATIONAL MERIT SCHOLARSHIP CORPORATION

Edward C. Smith, President

Donivan J. Watley, Director of Research

The National Merit Scholarship Corporation was founded in 1955 for the purpose of annually identifying and honoring the nation's most talented youth. Merit Scholarships, which are awarded on a competitive basis, provide financial assistance that Scholars use to attend the colleges of their choice.

The NMSC research program was established in 1957 to conduct scholarly research related to the source, identification and development of intellectual talent. NMSC Research Reports are one means of communicating the research program's results to interested individuals.

NMSC research is currently supported by grants from the National Science Foundation and the Ford Foundation.

ABSTRACT

During the 1950's a number of studies reported data showing that many test-bright academic achievers in high school were not entering institutions of higher learning. Despite the great expansion that has occurred in higher education since then, the question remains largely unanswered whether there are not significant numbers of academically talented students in disadvantaged populations—black or nonblack—who do not have access to higher education. A total of 28,800 were selected from among NMSQT participants to compose 72 subgroups formed on the basis of race (black or nonblack), sex, ability level, and geographical region of residence. The results strongly suggested that the test-bright achiever of either race is almost certain to enter college regardless of characteristics such as sex or parental earnings. Data are reported on the location and type of college attended, freshman year persistence, and grades obtained.

THE STATE OF THE PROPERTY OF T

BLACK AND NONBLACK YOUTH: CHARACTERISTICS AND COLLEGE ATTENDANCE PATTERNS

Donivan J. Watley

Between the early 1950's and the mid-1960's considerable attention was directed toward the identification and development of the nation's numan resources. This was done with an eye toward the efficiency with which society develops its human talent, concentrating specifically on how talent waste might be avoided. A national manpower council was established in 1951, and an ensuing report was published (1954) that dealt with various issues and problems of national manpower. A particularly important study that provided additional thrust to the need for manpower conservation was published by Wolfle (1954).

It became increasingly clear to many educators and manpower experts that various concrete steps should be taken, especially in attempting to build a firmer bridge from high school to college for highly talented students. One such step taken was the formation in 1955 of the National Merit Scholarship Corporation for the purpose of identifying and honoring the nation's most academically able youth. Another step taken was a renewed interest by colleges in the question of scholarships and financial aid to talented but needy students. The Sputnik launchings in 1957, with their threat to America as the world leader in science, dramatized the urgency of the task at hand.

While "talent development" emphasizes differences among people and seeks the "best" for given positions, ideal democracy at work offers every person equal opportunity for self development. The implication is that every individual has the right to be educated to the extent of his ability and desire, a belief which began to gain momentum in the nineteenth century and has snowballed in the course of the present century, especially during the 1960's. But this emphasis apparently requires that the traditional American educational system be changed: "American higher education, historically heterogeneous but usually designed for some selected population, is now asked to provide a useful experience for most young people, including those who cannot afford to pay the bills, are not 'prepared for college,' do not have 'college ability,' and do not arise from the backgrounds that have provided even the selfmade men of earlier times" (Kendrick and Thomas, 1970, p. 153).

These two emphases -- the conservation of society's talent and the individual's equal opportunity for educational development -- have together influenced students to seek higher education in greater numbers than ever before. In fact, the expansion of higher education in America, in terms of growth figures, has been a remarkable

success: there are now almost three times as many students enrolled in colleges and universities as there were in 1955; college enrollment nearly doubled from 1960 to 1968, while the population of 18-24 year olds was increasing about 30%. More than half of the nation's high school graduates now enter college, and in California, with its huge system of tax supported institutions, the percentage is much higher. Altogether, the percentage of the nation's graduates who enter some type of formal post-secondary education exceeds 70.

Although college officials appear confused today over their proper function in dealing with students who appear to lack the traditional requirements--inadequate preparation, poor motivation, low academic aptitude, etc., there is little confusion over the fact that most colleges seek to enroll the most academically able students that they can attract. Clearly, the emphasis is still on getting the superior student.

Despite the great expansion that has occurred in higher education, the question remains unanswered whether there are now significant numbers of academically talented students in disadvantaged populations (black or nonblack) who do not have access to higher education, Kendrick and Thomas (1970) concluded from their review that there is strangly little evidence available on this point. Moreover, in another review of studies on black higher education, Bayer and Boruch (1969, p. 2) found that: "Typically, research efforts have been confined to a small sample of subjects, often from a single educational level and enrolled in only one college or a small group of colleges." Their own report furnished needed normative data for entering college freshmen by type of institution and by race.

Although many of the details are missing regarding patterns of college attendance, it is known that blacks continue to be underrepresented in college in terms of their numbers in the total U. S. population. Altogether, 6 to 7% of the entrants to college in 1968 were black (Bayer and Boruch, 1969) and, according to Census Bureau data reported in the Chronicle of Higher Education (Feb. 15, 1971), the same percentage held for 1969. About 12% of the college age population in this country is black. Just 3% of the college graduates in 1965 were Negroes (Astin and Panos, 1969). Nevertheless, progress is being made. From 1964 to 1969 the number of blacks enrolled in college increased 110%, from 234,000 in 1964 to 492,000 in 1969. Between 1964 and 1968 the proportion of blacks aged 18-24 in college increased from 8 to 15% (U. S. Bureau of Census, 1969a).

Attempting to control a number of relevant student characteristics (e.g., race, sex, academic ability level, high school grades, type of high school attended, family income, geographical area of residence), the purpose of this study is to report

college attendance patterns among carefully selected samples of black and nonblack youth. Concentrating on the college attenders, data will be reported for their freshman academic performance and the type and location of the colleges they attended.

METHOD

SAMPLES

The National Merit Scholarship Corporation conducts the nation's largest private scholarship program—a program initiated in 1955. Approximately 750,000 students from about 17,500 high schools voluntarily participate in the annual nationwide scholarship competition. Of this number, about 35,000 are blacks who complete for awards in the National Achievement Scholarship Program for outstanding Negro students. Altogether, about 28% of all eleventh grade students participate by taking the National Merit Scholarship Qualifying Test (NMSQT).

The samples for this study were chosen from among the 796,650 students who took the NMSQT in the spring of 1967. A total of 28,800 were selected to compose 72 subsamples formed on the basis of race (black or nonblack), sex, ability level, and geographical region of residence. Initially, each of the 796,650 students was classified into a single subgroup based on his particular attributes. The students selected for this study were chosen randomly within each subgroup. A total of 400 were selected for each subsample in order to provide stable results.

The states included in the four geographical regions (East, Midwest, South, and West) are shown in Figure 1.

East	Midwest	South	West
Connecticut Delaware District of Columbia Maine Maryland Massachusetts New Hampshire New Jersey New York Pennsylvania Rhode Island Vermont Virginia West Virginia	Illinois Indiana Iowa Michigan Minnesota Missouri Ohio Wisconsin	Alabama Florida Georgia Kentucky Louisiana Mississippi North Carolina South Carolina Tennessee	Alaska Arizona Arkansas California Colorado Hawaii Idaho Kansas Montana Nebraska Nevada New Mexico North Dakota Oklahoma Oregon South Dakota Texas Utah Washington

Fig. 1 Regions

Using NMSQT scores, three levels of academic ability (or educational development) were used for blacks and six levels for nonblacks. The three levels for blacks corresponded to the first, second, and third quarters of the MMSQT selection score distribution for the 1967 Achievement participants. That is, the first level corresponded to the 75-99 quartile, the second level to the 50-74 quartile, and the third to the 25-49 quartile. Samples were chosen among the nonblacks to match those falling in the 25-49 and 50-74 quartiles. But nonblacks tend to score higher on the NMSQT than the blacks do--about 70% of the nonblacks scored above the 75th percentile of the black students selection score distribution. Therefore, while the top quartile of the black distribution included selection scores from 91-170, four levels of scores were used for the nonblacks within this range in order to provide a more detailed picture of the college attendance patterns for them. The top level for the nonblacks included those scoring in the top 10% on the NMSQT selection score distribution for the nonblacks, the second level included the next 10% on the nonblack percentile distribution (80-89), the third level was composed of those whose scores fell in the next 25% on the nonblack distribution (55-79), and the fourth level included nonblacks, in the next 25% (30-54) on the nonblack percentile distribution. Altogether, then, there were six levels for the nonblacks.

A total of 72 subsamples were formed as shown in Figure 2. These carefully selected samples were representative of the NMSQT participants who had the various attributes under consideration. It is important to recognize, however, that the students who do participate in this program do so voluntarily (although many do so at the request of their schools), so that the generalizability of these results are limited in the sense that the students are self selected. While almost all of the high ability students in America take the NMSQT, students with lower tested academic ability are less likely to take it. Students who scored in the bottom quartile of the black students distribution were not included in this study because this group may not be representative of students who obtain scores this low.

FOLLOWUP QUESTIONNAIRE

Having taken the NMSQT in 1967 as high school juniors, the students in this study normally entered coilege in the fall of 1968. About one year later, in late 1969, each person was asked to complete a 1-page questionnaire that requested information about his post-high school experiences? Did you attend college during the 1968-1969 school year? If you attended, how much of the school year did you complete? Which college did you attend? What grade average did you earn for the course work taken during your freshman year? How do your parents feel about your going to college? Ithough not included in this report, other information was obtained from the college

Fig. 2 Design of the College Attendance Study

attenders about their college major plans, their career plans, and their sources of financial support.

The colleges attended were classified by type: (1) public 2-year, (2) public 4-year, (3) private 2-year; and (4) private 4-year. It was also determined whether a student entered a college located in his own state or region (East, Midwest, South, or West).

Students were asked to estimate their family income (before taxes) for the previous year: (1) \$4,000 or less; (2) \$4,001-\$6,000; (3) \$6,001-\$8,000; (4) \$8,001-\$10,000; (5) \$10,001-\$12,000; (6) \$12,001-\$15,000; (7) \$15,001-\$20,000; (8) \$20,001 or more. This variable was used to represent students socioeconomic status (SES): (a) low--\$6,000 or less; (b) moderate--\$6,001-\$12,000; (c) high--\$12,001 or more.

Students were initially identified as blacks by having checked on the NMSQT answer sheet as high school juniors that they were eligible for and wished to be considered for scholarship aid through the program reserved for outstanding Negroes. Students were not asked to indicate their race as such on the NMSQT answer sheet. To check whether those selected for this study had been accurately classified "black" or "nonblack," the participants were asked to indicate their race on the followup questionnaire. Those who were initially classified incorrectly were changed according to the race they indicated on the questionnaire.

The student addresses used to mail the questionnaire were about two and one-half years old. The addresses available were those on the NMSQT answer sheets, completed in the spring of 1967. Two additional mailings were sent to the nonresponders after the initial questionnaire mailing. It is estimated that 2,592 of the participants were not located and did not receive the questionnaire.

ADDITIONAL INFORMATION

Other information obtained during the NMSQT testing was used in this study. This included: intention of entering college (yes or no), first and second college preferences, high school grade average, type of high school attended (public, independent, or parochial), location of the high school attended, and the population of the area served by the local school system (10,000 or less; 10,000-50,000; 50,000-250,000, 250,000 or more.

RESULTS

Response to the Questionnaire

Of the 28,800 who were mailed questionnaires, about 9% never received them. Questionnaires containing some usable information were returned by 11,207 nonblacks from the 17,472 that were presumably delivered-a return rate of 64%. Overall, the return rate was higher for women than for men-68% to 59%--and slightly higher in the

Midwest (66% both sexes combined) than in the West (64%), East (63%), or South (61%). The return rate was related to students NMSQT selection scores, being highest among those who obtained scores in the 131-170 range and lowest among those who obtained scores in the 62-74 range. Across all regions, for example, the response rate for nonblack women in the 131-170 range was 84% but only 43% for those in the 62-74 range. The corresponding percentages for nonblack men were 75 and 40. Thus a clear response bias is present which will require constant consideration in attempting to interpret these results. Consequently, greatest attention will be focused on those who obtained relatively higher NMSQT selection scores. The results for students at the lower end of the NMSQT distribution should necessarily be interpreted cautiously.

The results for blacks also require careful interpretation since only 52% of them returned usable data. As with nonblacks, the return rate was higher for women than for men--57% to 46%. But unlike the nonblacks, the rate of return was higher (both sexes combined) in the South (57%) than in the other geographical areas (West 52%; East 50%; Midwest (47%). The return rate for blacks was related to NMSQT scores. Returns were greater for those in the 91-170 range than for those scoring in the 62-74 range. The return rate for all women in the top NMSQT range was 62%, while the rate for those in the lowest range was 50%. The corresponding rates for men were 52% and 41%.

Information obtained from relatives revealed that at least 14 of the participants selected for this study were deceased. It was also learned that 337 of the participants were high school sophomores rather than juniors when they took the NMSQT. Their data were eliminated since they were not eligible according to the research design of this study.

One questionnaire item requested that the responder indicate his or her race. Of those who were initially thought to be black, 128 men and 62 women indicated on the followup questionnaire that they were not black. These participants were not eligible for Achievement scholarships in the first place and they were transferred from the status of "black" to "nonblack." On the other hand, 23 men and 57 women initially selected as nonblacks indicated that they were "black" and the appropriate transfer from "nonblack" to "black" was made.

College Attendance Among Black and Nonblack Youth

Virtually 100% of the students selected for this study indicated as eleventh graders that they planned to attend college; race, sex, geographical area of residence, SES (high, moderate, or low) or NMSQT score made no difference. Moreover, virtually 100% of the questionnaire responders reported that their parents wanted them to go. Those who take the NMSQT, then, appear to be volunteers who want to

attend college. But how many actually go? Are nonblacks more likely to attend college than blacks?

Let us look first in Table 1 at the college attendance patterns for black and nonblack males whose scores fell in the 91-170 range on the NMSQT. Not only did a remarkably high percentage of the nonblacks in this range actually enter college, but the percentages held up equally well for the highest scoring blacks regardless of SES level. Only in the South did a significantly higher percentage of nonblacks enter college, but even here the percentage difference is slight (97% to 93%). However, a consideration of the questionnaire return rate is important here. The response rate for all nonblack males in the 91-170 range was 66% and the rate for blacks was only 52%. It is questionable whether the nonattenders were as likely as the attenders to return the questionnaire. From the questionnaires received we know that, at a minimum, about 50% of the black males with NMSQT scores in the 91-170 entered college, but we do not know about the other half--the nonresponders.

Unfortunately, it was not possible to conduct a further investigation of the nonresponders. Possibly the difference in return rates for the blacks and nonblacks served to mask a real difference in attendance rates favoring the nonb acks. cannot be sure. The letter accompanying the questionnaire emphasized that an important reason for conducting this study was to identify deserving students who did not have a chance to enter college. The interpretation problem may be complicated by the belief among many blacks today that the time is overdue when attention should be placed on action programs rather than on continued sterile and aloof research of minority group issues. "The word is out," notes Knoell (1970, p. 1), "that black people do not want to be studied further, least of all by middle class white scholars." Thus nonresponders here may indicate other motivations rather than simply whether or not a person would report that he was enrolled in a college. Some support for this view may be found in an earlier followup by Burgdorf (1969), which studied several groups of black nonresponders to an Achievement questionnaire original response rates were low for some groups, as low as 58%, he concluded that these initial nonresponders "tended to deviate from the original responders only slightly and in the expected direction" (p. 10).

The return rates for men in the 75-90 and 62-74 NMSQT ranges also may have influenced the results reported. Certainly at first glance these college attendance rates seem high when one considers, for example, that an NMSQT score of 74 falls at the 10th percentile on norms for 1967 college bound NMSQT participants and at the 44th percentile on norms for a national sample of 11th graders. Although these selection scores are relatively low, an important self-selection factor is involved;

virtually all of the NMSQT participants want to attend college regardless of their test performance. Thus college attendance may well be substantially higher for them than is the case for other students with similar characteristics but with lower motivation to attend college. While these enrollment figures may seem high, it is relevant that 55 to 60% of all high school graduates now enter college (U. S. Office of Education, 1969a), and the percent who enter some type of formal post-high school education is over 70.

In general, college attendance is much higher for white males than females, the ratio being about 3 to 2 (U.S. Office of Education, 1969b). This ratio apparently Bayer and Boruch (1969) of the American Council on Educadoes not hold for blacks. tion reported that 54% of the entering college black freshmen in 1968 were women, which is the year the students in this investigation initially enrolled. Table 2 indicates that regardless of SES level (parental income) the black women who scored highest (91-170) in the Merit competition were just as apt to enter college as were the nonblack women with comparable test scores. Importantly, 77% of the nonblack and 62% of the black women in this range returned usable questionnaires. The percentages for women (Table 2) are only slightly different from those for men (Table 1) with comparable characteristics. While 40% of the black women with scores in the 91-170 range had parents with annual earnings of less than \$6,000, only 13% of the nonblacks had parents at this income level. This 40% figure is low, however, when all black female entrants to college in 1968 are considered; Bayer and Boruch (1969) found that 56% of them reported parental incomes under \$6,000.

Like the men, black women with scores in the 75-90 and 62-74 ranges were more likely to attend college than were the nonblacks with similar NMSQT selection scores, especially in the Western and Eastern regions (Table 2). Interestingly enough, the response rates for both races of women were about 57% in the 75-90 range and both were in the low 40's for those with scores in the 62-74 range. So the higher college attendance rates for blacks in this case cannot be accounted for simply on the basis of a difference in the proportions who returned the questionnaire. Perhaps a higher percentage of blacks-both men and women--at the lower measured aptitude levels really do enter college. Several reasons may lead one to this conclusion: the belief among many that academic aptitude tests have less relevance for blacks than for non-blacks (see Stanley, 1971 and Clark and Plotkin, 1963 for different views on this issue); the current emphasis among blacks of the importance of college; and the markedly increased efforts by many colleges to recruit blacks into their programs.

Talent conservationists have since the 1950's been concerned about the undeveld brainpower of this nation. If there is still uncertainty about whether test-

bright academic achievers estudents with high scholastic aptitude test scores who earn A to B+ high school averages—attend college, Tables 3 and 4 suggest that there is little cause for worry. Both tables reveal that 99% of the nonblacks who got NMSQT selection scores at the 90th percentile or better on numblack norms (scores in the 131-170 range) entered a college or university. But it is not just those at the very top who enter—98% of the nonblack males and 96% of the nonblack females with scores in the upper 70% (91-170) of the conblack norms entered a college somewhere. Parental income was unrelated to whether males with these characteristics entered college, and it had little bearing on the attendance of women.

The results were the same for blacks who scored highest on their own NMSQT selection score distribution-97% of the males and 95% of the females who scored in the top quarter of the black distribution (in the 91-170 range) entered college. The attendance ratios are almost as high for males and females of each race who had high test scores but who compiled a high school grade average in the C+ to B range.

An important objective here was to provide information about the proportions of highly adacemically talented students with certain characteristics who do not attend college. These data strongly suggest that the test-bright achiever--either black or nonblack--is almost certain to enter college regardless of characteristics such as sex or parent's income bracket.

The type of high school--public, independent, or parochial--that bright achieving males attend appears to have little effect on their college attendance rates (Table 5). This is true also for nonblack females who scored in the top 45% of the nonblack NMSQT selection score distribution (106 or higher). But nonblack women from parochial schools who obtain lower test scores were somewhat less likely to attend college than other women with similar characteristics who went to public or independent schools. Black women graduates from parochial schools were consistently less likely to enter college (except in the 62-74 range) than were graduates from the other two types (Table 6).

Tables 7 and 8 present data on the relation of college attendance to the size of the high school system where a student resided. So far the results presented here have consistently shown that high scoring males go to college regardless of their particular set of conditions. Size of high school system does not deviate from this pattern. This variable appears to have no significant bearing on whether a test-bright black or nonblack male will attend college. This holds also for nonblack women who obtain top test scores. Table 8 reveals, however, that those with scores below 106 from systems of less than 10,000 were not as apt to enter college as those in similar characteristics from larger systems. Lower scoring black women (90 or

below) from the smallest sized school system also were less likely to attend college than those coming from the bigger systems.

College Attendance and College Preferences

Which colleges do students most want to attend? For a number of years approximately the 50,000 students scoring highest in the National Merit talent search were asked to name their top two college choices (Astin, 1965; Nichols, 1966). Blumenfeld (1968) asked the same question of 1,029 black Finalists in the National Achievement Program for outstanding Negroes. Since these black and nonblack students were widely distributed geographically, one might expect that they would desire to spread themselves widely among many colleges. This was not the case. In this popularity contest involving only the very brightest students, a relatively small number of colleges were named. It appears that students, particularly nonblacks, do indeed have particular colleges in mind that they would most like to attend. The results presented in this section relate the characteristics of college attenders to whether they entered their 11th grade first or second choice college.

In general black males were far less likely to enter the colleges they named than their nonblack counterparts (Table 9). But both black and nonblack Eastern males with higher test scores (91-170) were somewhat less likely to enter their top named colleges than males with similar characteristics who lived in other parts of the country. It is likely that Easterners more frequently than the others named prestigious Eastern private colleges as their top choices. Except for nonblacks who had NMSQT selection scores at the very top(131-170), the highest scoring (91-170 range) Southern nonblacks more frequently enrolled in their top choices than did their nonblack male counterparts in other geographical regions. Except in the East, low SES nonblacks more frequently entered their top choices than students with families in the higher income brackets.

Overall, nonblack women with scores in the 91-170 range were, like the men, far more likely to enter their preferred choices than were the black women (Table 10). Actually, the higher scoring nonblack women entered their first or second choice college about as often as did the higher scoring nonblack men. Eastern women in the 91-170 range less frequently entered a top choice than the others. In general, the low SES women more often than the high SES women enrolled in a top named college. Unlike the higher scoring nonblack men, Southern women did not enter a top choice more frequently than women in the Midwest or West.

Let us look a bit further at the question of college preference and consider the effect that high school grades seem to have. In general, Table 11 shows that grades were an important discriminator for nonblack males in the 91-170 range, but they did

not seem to play as important a part for blacks. Interestingly, black males in this NMSQT score range with C+ to B averages were just as likely to enter a top choice college as those with higher averages. It appears that some intensive recruiting was conducted to enroll blacks who obtain relatively high scores on scholastic aptitude tests like the NMSQT. This is quite likely connected to the fact that many of them did not enter the top choice colleges they named as juniors. Although it appears that the higher scoring blacks were eagerly sought, the argument has been made by some (Jenkins, 1964; Fishman et al., 1964; Clark and Plotkin, 1963; Green and Farquhar, 1965) that test information of this kind is of questionable value in predicting how black students will perform in college.

Table 12 shows that black women in the 91-170 range with C+ to B averages were just as apt to enter their top college choices as blacks with B+ to A averages. On the other hand, grades did play some role in whether the higher scoring nonblack women entered a top choice college. In general, the high SES nonblacks were somewhat less likely to enter a top named choice than nonblack women whose families had lower incomes.

Type of College Entered

Since nonblacks entered their first or second college preference much more frequently than the blacks did, it might be expected that more nonblacks than blacks went to 4-year private institutions, and a reverse trend in the 2-year and 4-year public institutions. Certainly the number of students enrolling in public junior colleges in the past few years has grown enormously. Tables 13 and 14 reveal some rather surprising results.

Over half (53%) of the black males in the top quarter of their own NMSQT selection score distribution (91-170 range) entered a 4-year private college in the fall of 1968, which is substantially higher than the 37% figure for nonblacks (Table 13). This percentage for blacks is especially high when it is considered that only about 24% of all first-time entering students in 1968 enrolled in privately controlled institutions (U. S. Office of Education, 1969b). The attendance rate at 4-year private institutions for blacks whose parents had incomes over \$12,000 was 59%. Only nonblacks with scores in the 131-170 range had as many as 50% in that type of college, and only those in this score range with parents making over \$12,000 reached a 58% figure. Interestingly, 50% of the blacks (in the 91-170 range) whose parents earned less than \$6,000 attended a 4-year private college.

Mention was made earlier the only 52% of the black males with NMSQT scores in the 91-170 range returned usable data for this study, and it was speculated that sibly a higher percentage of nonresponders than responders did not enter college.

elementary and recommendations and the second of the second second second second and the second second second

X • 1.

At this point we are concentrating on the attenders. So if it is true that a high percentage of the nonresponders did not attend college, the absence of information for them probably would not substantially affect the results presented here. Also, it is hard to see how a bias existed among students at private or public institutions regarding completing the questionnaire for this study.

If the higher scoring black males were less likely than nonblack males to enter their first or second choices, it was not because they had to enter 2-year public colleges instead. Only 4% of these blacks enrolled in colleges of that type, which is considerably below the 23% figure revealed in Bayer and Boruch's (1969) data for all blacks who entered 2-year colleges in 1968. Perhaps the naming of most preferred colleges has not yet been practiced as much among blacks as among nonblacks, so that the naming of one's top two college choices has less meaning for them. But maybe they were not recruited by the particular colleges or universities they most wanted to attend. Or maybe they were recruited by "better" schools than they had in mind initially.

Essentially the same results were found for women as for men with NMSQT selection scores in the 91-170 range. However, a slightly lower percentage of these bright black women were enrolled in 4-year private colleges than was the case for men-- 48% to 53% (Table 14). About the same proportions of black women entered 4-year public and 4-year private colleges. In contrast, the proportions of nonblacks in the 91-170 range enrolled in the different types of colleges were about identical. This was true even for those nonblacks who scored in the top 10% of their own NMSQT distribution (131-170).

How Well Did Students Persist?

Enrolling in a college does not necessarily mean that a student will stay very long. Much of the published evidence about student persistence is discouraging, the dropout rate within a single year sometimes reaching as high as 45 or 50%. Recent data for blacks, however, does not paint a picture that bleak (e.g., Tetlow,1969; Nicholson, 1970; Borgen, 1970; Astin, 1970). These studies indicate that although blacks do not get A or B grades as frequently as whites do, they are able to persist in their academic programs. How well did these students persist in their first year of college?

Very high percentages of black and nonblack students of both sexes completed the freshman year (Tables 15 and 16). Students who entered a 4-year public college fared about the same as those who attended a 4-year private college. But the persistence rate for both sexes was lower for students who entered 2-year public colleges.

Freshman Grades

Tables 17 and 18 show that a substantially higher percentage of nonblacks than blacks got A or B freshman averages. However, only small percentages of either group earned less than a C average. The same percentages of nonblack males in the 91~170 range got A averages in 4-year public and 4-year private colleges, but a slightly higher percentage (48% to 42%) of them got B averages in the latter type of college. Blacks also did a little better in 4-year private than in 4-year public colleges, although over 50% got C averages in both types.

About three-quarters of the nonblack women got A or B grade averages, while 50% of the blacks got averages that high (Table 18). Only 59% of the nonblack males and 38% of the black males got A or B averages. Like the men, the women generally did slightly better in 4-year private colleges than they did in 4-year public colleges. D or F averages were very rare among men, but they were even rarer among women; 1% of the nonblack women and 4% of the black women reported below C averages. It is possible, however, that these percentages are lower than was actually the case. Perhaps those who did not do well academically were less likely to provide information to us about their grades.

Since about 70% of the nonblacks scored above the 75th percentile of the black students' NMSQT selection score distribution, the mean NMSQT score for nonblacks in the 91-170 range is higher than the mean for blacks. This difference should be considered in interpreting the results for college grades earned by the two races. Location of the College Attended

Are some students with certain characteristics more likely to attend a college in their home state than other students with different characteristics? Parental income, for example, would be expected to affect whether a student is financially able to attend an out-of-state college.

Tables 19 and 20 do in fact show that students with parents in the low income bracket (\$6,000 or below) were much more likely to attend a college in their home state. Interestingly enough, while this relationship holds for both blacks and non-blacks, blacks were generally less likely than nonblacks with similar characteristics to enter a home-state college. For example, 81% of the nonblack males scoring in the 91-170 NMSQT range with low income parents entered an in-state-college, while the comparable percentage for blacks was only 67. Males were a bit more likely than females with similar characteristics to go to an out-of-state college. Eastern students of both sexes were somewhat more likely to attend an out-of-state college than were students from the other regions.

Note:--Comparisons are made in each cell between the percentages of blacks and nonblacks who attended college in their home state; the differences that are statistically significant have this designation: * = p .05 level; ** = p .01 level; ** = p .01 level; ** = p .01 level.

High school grade average was also related to whether a student went to college out-of-state. Having a B+ to A average was particularly related to out-of-state attendance for males. Almost half of the black male college attenders with averages that high went to a college located out-of-state. Proportionally fewer nonblacks with top grade averages went out of state; in fact, only 41% of the nonblack men with parents in the "high" income bracket went to an out-of-state college.

Regardless of her grades, the odds were about 50-50 that a black female with "high" SES parents went to college out-of-state, and if her grades were in the B+ to A range the odds were about 3 to 2 that she would. In contrast, only about a third of the "high" SES nonblack females with top grades went out-of-state. High school grades do not appear to be a powerful discriminator in determining whether nonblack women from "low" or "moderate" SES levels will go out-of-state--the great majority do not.

One might expect that in-state or out-of-state attendance would be related to the type of college attended. Tables 23 and 24 reveal that it is--students attending a 4-year public college were very likely to remain in their home state, while at least 50% of the students at 4-year private colleges went out-of-state. Well over half of the "high" SES students--black and nonblack--of both sexes at 4-year private colleges were attending out-of-state.

What proportions of students do or do not go to colleges located in their own area (East, Midwest, South, or West) of residence (where they took the NMSQT). As would be expected, the great majority attend a college located in their own area (Tables 25 and 26). In the South, however, 29% of the black males and 23% of the black females with NMSQT scores in the 91-170 range left their region to attend college in some other area, most in the East. In fact, of the black and nonblack males who did leave the South, Midwest, or West, most went to the East. Women who left the Midwest or South most frequently went East. Parental income also had a bearing on whether students attended colleges outside their regional area; the "high" income families more frequently sent their sons and daughters to "outside" colleges than those less well off financially.

Another analysis was done where students high school grade averages were related to region of college attendance. In general, the grades of both black and nonblack males in the Midwest, South, and West were related to attending an "outside" college. Students with 3+ to A averages were more apt to be outside their own region. Interestingly, this relationship was not found for either black or nonblack males in the East. Grades did not appear to be as important a factor for women as for men in determining college attendance outside one's own area.

Note:--In the NMSQT range of 91-170, comparisons are made in each cell between the percentages of blacks and nonblacks who attended college in a given geographical area; the differences that are statistically significant have this designation: * = p .05 level; ** = p .01 level; ** = p .001 level.

ERIC

SUMMARY

This study was designed to obtain information about the college-going patterns of students with different characteristics who participate in the scholarship programs of NMSC. The results should be interpreted carefully because many students selected for the study did not return the 1-page questionnaire mailed to them. Proportionally fewer blacks than nonblacks returned the questionnaire, and those who scored lower on the NMSQT did not return the questionnaire as frequently as did those who obtained relatively higher scores. However, the return rate was sufficiently high, particularly among the relatively high scorers, to warrent a number of tentative conclusions.

The conclusions reached are briefly summarized as follows:

- 1. Virtually all of the 11th grade students--regardless of sex, race, NMSQT selection score, parental income, geographical area of residence, etc.--who take the NMSQT plan to attend college, and according to them their parents are in favor of their going.
- The test-bright school achiever--male or female, black or nonblack--is almost certain to attend college regardless of family income level; in fact, at this time there are apparently few test-bright students with high school grades in the C+ to B range who don't go.
- 3. The type of high school attended (public, independent, parochial) or the size of the high school system where a student resides does not appear to be an important factor in determining the college attendance patterns of test-bright academic achievers.
- 4. Nonblack test-bright achievers of either sex were much more likely to enter their 11th grade first or second choice colleges than their black counterparts, although Eastern test-bright students-black or nonblack, male or female-were generally less likely to enter a top choice than students residing in other sections of the country. In general, students from low income families entered their top choices more frequently than those with families in the higher income brackets.
- 5. High school grades were an important discriminator in determining whether non-black males in the 91-170 NMSQT range entered their top choice college; for example, the lower income males with B+ to A averages were somewhat more likely to enter their top choices than B+ to A students whose families earned more. But grades were not an important factor for black males in the 91-170 range-those with C+ to B averages were just as likely to enter a top choice as those with higher averages.
- 6. Intensive recruiting apparently was conducted to enroll the blacks who scored highest on scholastic ability tests like the NMSQT; while blacks did not enter their top choices as frequently as the nonblacks did, they nevertheless did enter 4-year private institutions with high frequency, and surprisingly few of them entered 2-year colleges. High school grades in the B+ to A range were not more conducive to entering a top choice because the C+ to B blacks were also sought. Parental income was not an important factor either.
- 7. Very high percentages of black and nonblack students of both sexes completed the freshman year; persistence was much the same at 4-year public and 4-year private institutions.

- 8. Nonblacks typically got better grades than the blacks did, but few of either race received below C averages; black and nonblack women more frequently got A or B averages than their male counterparts.
- 9. In general, students with parents in the low income bracket (\$6,000 or below) were much more likely to attend a college in their home state than students whose parents earned more, but blacks were generally less likely than nonblacks with similar characteristics to enter a home-state college. Males were somewhat more likely than females with similar characteristics to go out-of-state, and Eastern students of both sexes were a bit more likely to attend an out-of-state college than were students from other regions.
- 10. High school grade average was related to whether a student attended an out-of-state college; having a B+ to A average was particularly related to out-of-state attendance for males, but a higher proportion of blacks than nonblacks with similar characteristics went out-of-state.
- 11. Students who entered a 4-year public college were most likely attending a home state college; at least 50% of the students at 4-year private colleges were at out-of-state institutions.
- 12. The great majority of students attended a college in their own geographic area (East, Midwest, South, or West) as defined in this study; however, 29% of the black males and 23% of the black females with NMSQT selection scores in the 91-170 range left the South to attend a college in one of the other areas. Most of those who leave their own area go to an Eastern college.

DISCUSSION

While the primary objective of this study was to obtain information about the college attendance patterns of participants in the scholarship programs of National Merit, a particular motivation was to attempt to identify test-bright academic achievers who desire college but are not able to attend. Admittedly, the proportions of students with various characteristics who responded to the 1-page questionnaire were not as high as one might have hoped they would be. Yet a number of tentative conclusions are possible. The results for the college attenders are perhaps more stable than for those who did not attend, because it is hard to see how biases would systematically cause some attenders to respond while others would not.

It is already known that a higher proportion of nonblacks enter institutions of higher learning than do blacks. The point of this study was to learn more about the patterns of attendance among college motivated youth who differ in various important ways. In this framework the emphasis is placed squarly on factors that lead to thought in terms of "educational advantages" or, conversely, "educational disadvantages" rather than to preoccupation with the idea that a person is disadvantaged because he happens to be a member of a minority group or because his skin happens to be a particular color. All members of a given race, ethnic group, or regional subculture are clearly not educationally disadvantaged. This conclusion has been

repeatedly borne out by studies of blacks who have received scholarship aid through the National Achievement Scholarship Program (Watley, in press). This point is also emphasized by Fichter (1967) in his study of graduates of predominantly Negro colleges:

"...the better educated Negro parents have provided certain advantages for their children. They undoubtedly anticipated their children's higher education and saw to it that they took the college preparatory curriculum in high school. In this regard, the upper class Negro students have a high school curriculum proportionately similar to that of the white students. ...The economic, occupational, and educational status of Negro parents obviously has a great influence on the academic aspirations and experiences of their children. In contrast, it is remarkable that any of the children of lower class Negro parents ever manage to attend and finish college" (p. 48).

What about the question: Are there now significant numbers of test-bright academic achievers with particular characteristics who do not enter college? Since the nonresponder problem is not as serious among the top-scoring nonblacks as among the blacks, one can reasonably conclude that there are indeed few high-scoring academically successful nonblacks who do not go to college. If there are, this investigation was not sufficiently controlled in terms of students characteristics to find them. Doubtless the situation has changed since the middle 1950's when Wolfle (1954), Iffert (1956), the Educational Testing Service (1957), Thistlethwaite (1958), and others reported data showing that many test-bright high school achievers were not going on to institutions of higher learning.

While a high percentage of the scholarship winners in the programs of NMSC typically complete followup questionnaires (e.g., Nichols and Ascin, 1966; Watley, 1969; Burgdorf, 1969), many nonwinners do not. Black nonwinners are now less apt to provide followup information about themselves than are the nonblacks who did not receive NMSC scholarships. It was hoped in this study that blacks and nonblacks alike, especially those who wanted to attend college but did not go, would want to tell us about their circumstances in order that other students similar to themselves could be identified. There are no doubt a number of complex reasons why many individuals did not respond. But judging from the many letters received, one important reason was that these students wanted financial aid themselves and none was offered.

Whatever the reasons may be that many did not respond, the results for blacks appeared reasonably consistent across the various geographical regions, and the findings are systematic when other factors are considered such as parental income level and NMSQT selection score. Thus it does not appear from these data that we are able to single out particular subgroups of test-bright achievers with given characteristics for further investigation because of unusually low college attendance rates.

Because the focus of attention here was upon the college attendance patterns of students with given characteristics, the belief is not implied that every student should attend college. This study concentrated on bright academic achievers who indicated that they wanted to attend college. In the interest of developing the nation's talent resources, NMSC has since its inception been concerned with identifying talented youth who want to continue their education. This is also consistent with the democratic ideal of helping individual students develop their talents to the extent of their ability and desire.

Many will not be surprised by the high college attendance rates found among these students. After all, nearly three times as many students now attend colleges and universities as in 1955. In fact, students are now attending institutions of higher learning in such a lockstep manner that the flow of students into college, frequently hailed as a great accomplishment, is now bring brought into question. "Far from enlarging the choice of educational experiences available to the young or producing unprecedented numbers of joyfully enlightened citizens," says Faltermayer (1970, p. 98), "the feverish expansion has reproduced with deadly conformity from coast to coast, a system originally designed for an elite of the intellectually curious and the professionally committed -- a system unchanged in basic concept since medieval times." It now appears possible to produce a society of people that is overly educated in terms of the knowledge required to do the various kinds of jobs that need to be done. Not unrelated to this situation is the fact that colleges and universities themselves are now in the midst of transition and soul-searching, and many issues (e.g., Open admissions and who should be educated? What should be taught? What are the best teaching methods?, etc.) are still being discussed heatedly.

While many youth today are greatly perplexed over the course of action to take, the desire of college officials to attract bright academic achievers to their institutions has continued unabated. It is still assumed that these bright students will be able to market their talents when their formal education is over. In fact, the assumption remains that these youth provide the hope for this country to retain its place as the world leader in science, and that through their leadership discoveries and cures can be found to help resolve many of the problems (e.g., environmental pollution) that man must somehow learn to cope with.
